In General, in this study two stratigraphic section from Jahrum formation, Jalab section (NW of Shiraz) and Sarvestan Section (SE of Shiraz) were considered. About 400 thin sections from these two sections were studied. On the base of identified foraminifers, the age of Jahrum formation is determined from Upper-Paleocene to Middle- Eocene. The type of microfacies in these sections is mudstone, wackstone, packstone and grainstone.
